

**You Are Invited to take part in a Study
Assessing the Differences in Parental Stress Between
PARENTS OF A TYPICALLY DEVELOPING CHILD WHO
HAVE NO DIAGNOSIS OF AUTISM OR ANY
DEVELOPMENTAL DISORDER, & PARENTS OF CHILD WITH
A DIAGNOSIS OF AUTISM Between the Ages of 10 -17 Years**

What is the study about?

The study aims to examine the differences in parental stress levels between parents or carers of children with autism and parents or carers of typically developing children who have no diagnosis of autism or any developmental disorders.

What is the goal of the study?

The goal of the study is to aid our understanding of possible stress associated with parenting in both groups. Findings from the study will be published in academic journals to aid future research in the area of parenting and autism.

Interested in the study?
